Scenario

A suspected case of measles was reported in the Rustavi rayon of Kvemo Kartli on 15 January 2019. Blood and nasopharyngeal swab samples were sent to the lab.

1. Lab results confirm the diagnosis of measles. Begin by entering an Active Surveillance Standalone Session.
2. Enter a new Active Surveillance Campaign and link the standalone session to it.
3. During your investigation, you discover two more cases that were seen in one of the rayon's clinics in the previous two weeks. Search for the campaign and adjust the End Date to ensure that the campaign covers at least two incubation periods.
4. Your investigation leads you to sick students at a local primary school in Gardabani of Kvemo Kartli. Add a new session linked to the campaign and enter some blood and nasopharyngeal samples obtained at this location.
5. Search for the session and add that confirmed cases have been quarantined.
6. To complete this exercise, delete the Campaign and the Session.
